《机器学习》课程实验报告

学	院 _	软件学院	
专	业_	软件工程	
组	员 _	李彩利	
学	号 _	201530611920	
即	箱 _	2561170837@qq. com	
指导教师		吴庆耀	
提交日期		2017年 11 月 15 日	

- 1. 实验题目: 逻辑回归、线性分类与随机梯度下降
- 2. 实验时间: 2017年 12 月 8 日
- 3. 报告人:李彩利
- 4. 实验目的:
- 1. 对比理解梯度下降和随机梯度下降的区别与联系。
- 2. 对比理解逻辑回归和线性分类的区别与联系。
- 3. 进一步理解 SVM 的原理并在较大数据上实践。

4. 数据集以及数据分析:

实验使用的是 <u>LIBSVM Data</u>的中的 <u>a9a</u>数据,包含 32561 / 16281(testing)个样本,每个样本有 123/123 (testing)个属性。将数据集切分为训练集和验证集

5. 实验步骤:

逻辑回归与随机梯度下降

- 1. 读取实验训练集和验证集。
- **2.** 逻辑回归模型参数初始化,可以考虑全零初始化,随机初始化或者正态分布 初始化。
- 3. 选择 Loss 函数及对其求导,过程详见课件 ppt。
- 4. 求得部分样本对 Loss 函数的梯度。
- 5. 使用不同的优化方法更新模型参数(NAG,RMSProp,AdaDelta 和Adam)。
- 6. 选择合适的阈值,将验证集中计算结果**大于阈值的标记为正类,反之为负类**。 在验证集上测试并得到不同优化方法的 Loss 函数值。

7. 重复步骤 4-6 若干次, 画出 Loss 函数值和随迭代次数的变化图。

线性分类与随机梯度下降

- 1. 读取实验训练集和验证集。
- 2. 支持向量机模型参数初始化,可以考虑全零初始化,随机初始化或者正态分布初始化。
- 3. 选择 Loss 函数及对其求导,过程详见课件 ppt。
- 4. 求得部分样本对 Loss 函数的梯度。
- 5. 使用不同的优化方法更新模型参数(NAG, RMSProp, AdaDelta 和 Adam)。
- 6. 选择合适的阈值,将验证集中计算结果**大于阈值的标记为正类,反之为负类**。 在验证集上测试并得到不同优化方法的 **Loss** 函数值。
- 7. 重复步骤 4-6 若干次, 画出 Loss 函数值和随迭代次数的变化图。

7. 代码内容:

逻辑回归和随机梯度下降

         train_loss = (sum(max(0,1-y_train[i]*function(x_train[i],w,b))) for i in
range(x train len)))/x train len
         test loss = (sum(max(0,1-y test[i]*function(x test[i],w,b))) for i in
range(x test len))/x test len
    #
          if (loss - train loss) > 0:
    #
          loss = train loss
         train new loss.append(train loss)
```

```
test_new_loss.append(test_loss)

# else:

# break

print(train_new_loss)

print(test_new_loss)

plt.figure(figsize=(8,6))

plt.xlabel('Gradient descent - Iteration times')

plt.ylabel('Loss')

plt.plot(range(count), train_new_loss, 'o-', label=u"Training Set")

plt.plot(range(count), test_new_loss, 'r-', label=u"Testing set")

plt.legend()

plt.grid()

plt.show()
```

8. 模型参数的初始化方法:随机初始化

9.选择的 loss 函数及其导数:

逻辑回归
$$J(w) = -\frac{1}{\pi} \left[\sum_{i=1}^{n} y_{i} \log h_{w}(x_{i}) + (1-y_{i}) \log (1-h_{w}(x_{i})) \right]$$

$$\frac{\partial J(w)}{\partial w} = (h(x)-y) \chi$$

$$\frac{\partial L(f)}{\partial w} = \sum_{i=1}^{n} ma_{i} \chi(0, 1-\hat{y}\cdot f(x_{i}))$$

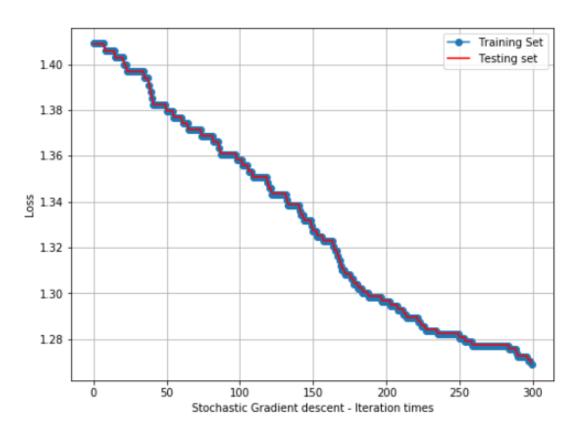

$$\frac{\partial L(f)}{\partial w} = \sum_{i=1}^{n} -\delta(\hat{y}_{n}f(x_{i})) \times (1-\hat{y}) \cdot \hat{y}^{n} \chi$$

10.实验结果和曲线图:(各种梯度下降方式分别填写此项)

超参数选择: 0.1

预测结果(最佳结果): 1.1

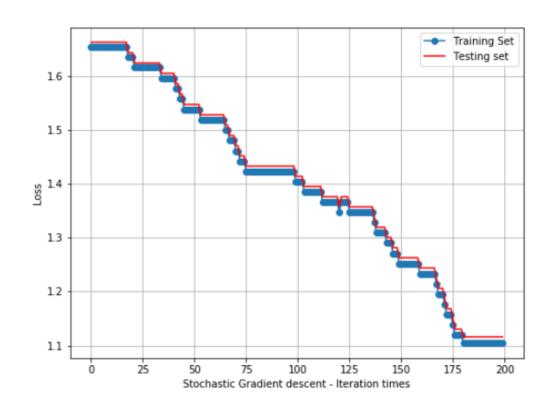

loss 曲线图:

超参数选择: 0.01

预测结果(最佳结果): 1.1

loss 曲线图:

11.实验结果分析:

逻辑回归和线性分类的 loss 越来越小,采用 NAG,RMSProp,AdaDelta 和 Adam 等参数更新法可以加快速度

12.对比逻辑回归和线性分类的异同点:

从<u>目标函数</u>来看,区别在于逻辑回归采用的是 logistical loss,svm 采用的是 hinge loss.这两个<u>损失函数</u>的目的都是增加对分类影响较大的数据点的权重,减少与分类关系较小的数据点的权重.SVM 的处理方法是只考虑 support vectors,也就是和分类最相关的少数点,去学习分类器.而逻辑回归通过非线性映射,大大减小了离分类平面较远的点的权重,相对提升了与分类最相关的数据点的权重.两

者的根本目的都是一样的.此外,根据需要,两个方法都可以增加不同的正则化项,如 11,12 等等. 但是逻辑回归相对来说模型更简单,好理解,实现起来,特别是大规模线性分类时比较方便.而 SVM 的理解和优化相对来说复杂一些.

13.实验总结:

学会了逻辑回归与线性回归、随机梯度下降和梯度下降的区别
